Mind Wide Open™

Methods of Sending Data in the Network

Unicast

means send data for one or all receivers.

▪ Multicast

means send data for some receivers or all.

▪ Broadcast

means send data for all receivers.

Transmission types

Single

Transmission in one direction only

▪ Half duplex

Transmission in the two directions but not at the same time

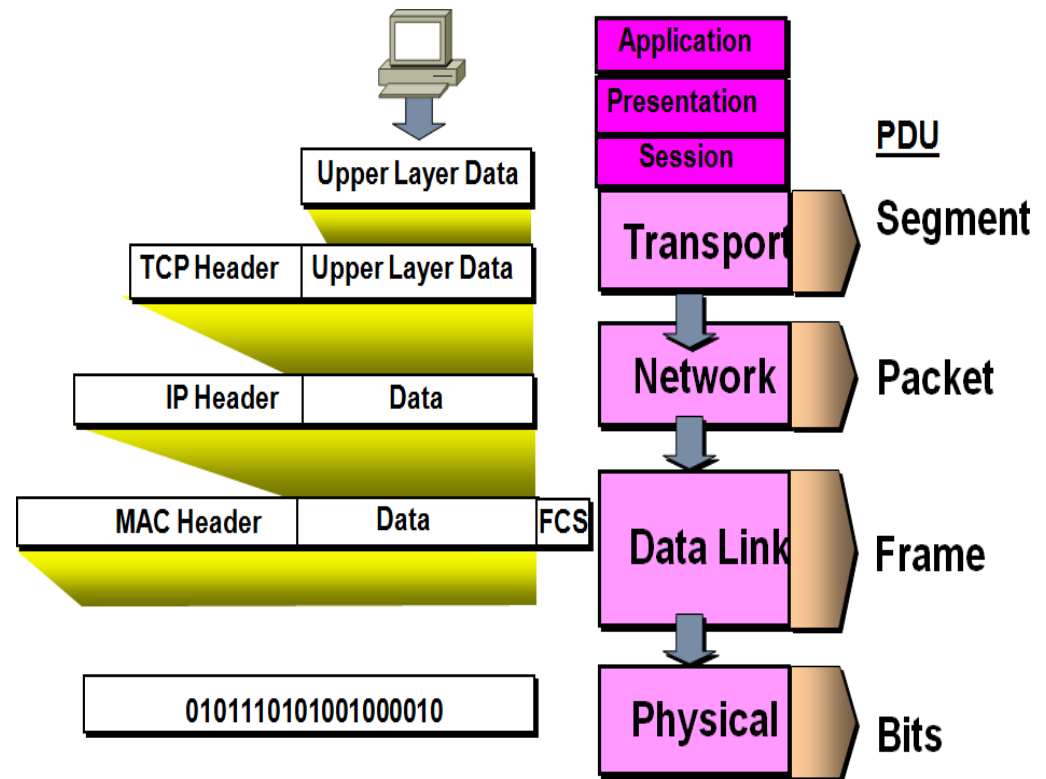

▪ Full duplex

Transmission in the two directions at the same time

2- Data link

- Data frame format
- MAC Address.
- Error detection

MAC address table

- Initial MAC address table is empty.
- Address learning
- Forward/filter decision

Learning addresses

ICND20GR_109

- Station A sends a frame to station C.
- Switch caches the MAC address of station A to port E0 by learning the source address of data frames.
- The frame from station A to station C is flooded out to all ports except port E0 (unknown unicasts are flooded).

Learning addresses

- Station D sends a frame to station C.
- Switch caches the MAC address of station D to port E3 by learning the source address of data frames.
- The frame from station D to station C is flooded out to all ports except port E3 (unknown unicasts are flooded).

Filtering frames

- Station A sends a frame to station C.
- Destination is known; frame is not flooded.

MAC Table for Switch0

VLAN	Mac Address	Port
1	0001.97BE.B16C	FastEthernet0/1
1	0006.2AC5.11B4	FastEthernet0/2
1	0060.7097.D1CD	FastEthernet0/3

ARP Table for PC0

IP Address	Hardware Address	Interface
10.0.0.2	0006.2AC5.11B4	FastEthernet
10.0.0.3	0060.7097.D1CD	FastEthernet

ARP Table for PC1

Devices and the layers at which they operate

Layer	Name of Layer	Device
3	Network	Routers, layer 3 switches
2	Data Link	Switches, bridges
1	Physical	Hubs

Hubs: One Collision Domain

- More end stations means more collisions

Switches

- Each segment has its own collision domain
- Broadcasts are forwarded to all segments

Hubs Operate at Physical layer

- All devices in the same collision domain
- All devices in the same broadcast domain
- Devices share the same bandwidth

Switches and Bridges Operate at Data Link Layer

- Each segment has its own collision domain
- All segments are in the same broadcast domain

Router Operate at Network layer

All interfaces of the router are members in a multiple broadcast domain, and multiple collision domains

Find number of broadcast domains and number of collision domains

Solution :

no. of broadcast domains = 1

no. of collision domains = 1

Find number of broadcast domains and number of collision domains

Solution :

no. of broadcast domains = 1

no. of collision domains = 4

Find number of broadcast domains and number of collision domains

Solution :

no. of broadcast domains = 2

no. of collision domains = 6

Find number of broadcast domains and number of collision domains

Solution :

no. of broadcast domains =

no. of collision domains =

Find number of broadcast domains and number of collision domains

➤ Red circle for Collision
➤ Purple circle for Broadcast

Which of the following statements describe the network shown in the graphic? (Choose two.)

- A. There are two broadcast domains in the network.
- B. There are four broadcast domains in the network.
- C. There are six broadcast domains in the network.
- D. There are four collision domains in the network.
- E. There are five collision domains in the network.
- F. There are seven collision domains in the network.

Correct Answers: A,F

Explanation:

Only router can break up broadcast domains so in the exhibit there are 2 broadcast domains: from e0 interface to the left is a broadcast domain and from e1 interface to the right is another broadcast domain.

Both router and switch can break up collision domains so there is only 1 collision domain on the left of the router (because hub doesn't break up collision domain) and there are 6 collision domains on the right of the router (1 collision domain from e1 interface to the switch + 5 collision domains for 5 PCs in Production).

How many broadcast domains are shown in the graphic assuming only the default VLAN is configured on the switches?

- A. one
- B. two
- C. six
- D. twelve

Correct Answer: A

Explanation:

Only router can break up broadcast domains but in this exhibit no router is used so there is only 1 broadcast domain.

For your information, there are 7 collision domains in this exhibit (6 collision domains between hubs & switches + 1 collision between the two switches).

Find number of number of collision domains

Solution :

No. of broadcast domains = 3

No. of collision domains = 9

IP-V4 Addressing

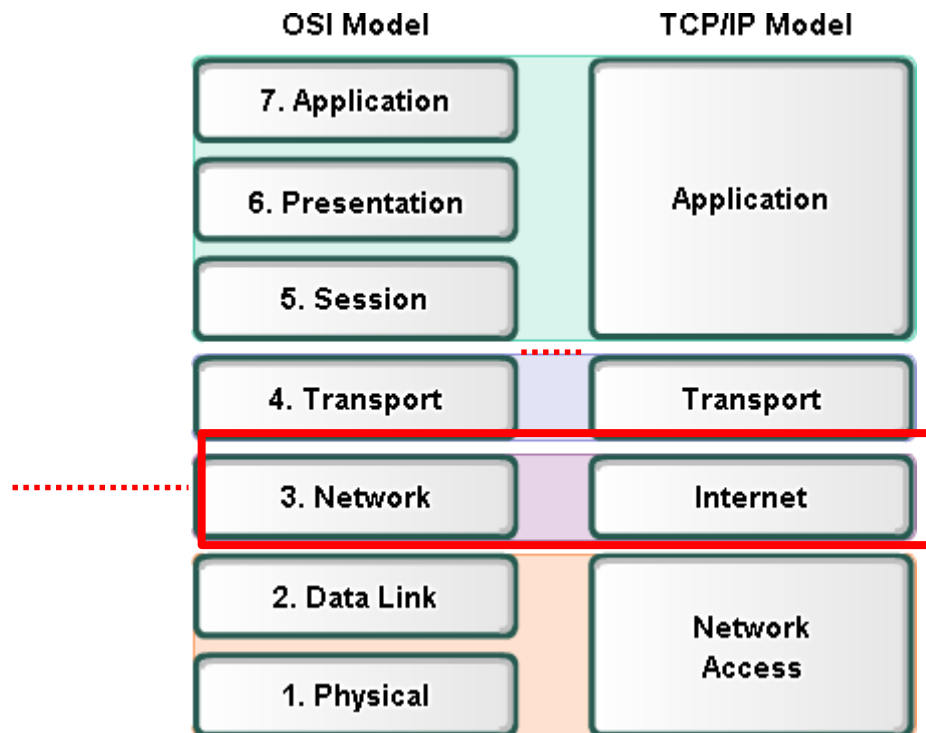

Network Fundamentals

Cisco | Networking Academy®
Mind Wide Open™

Network Layer

IPv4

Addressing at layer 3

192.168.100.99

Source IP = 192.168.100.99

Destination IP = 172.16.3.10

Source IP = 172.16.3.10

Destination IP = 192.168.100.99

172.16.3.10

Range (224-239)

ICND20GR_22

Test a connectivity

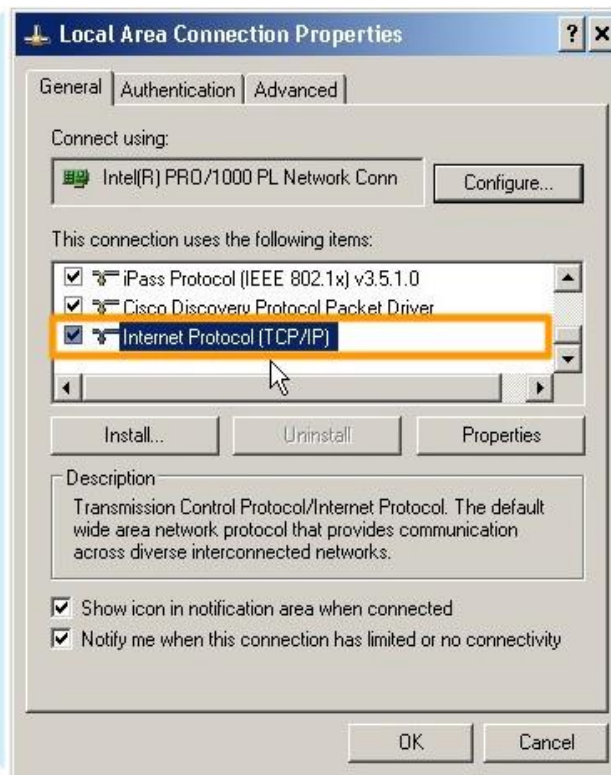

- IP must be Unique
- IP 127.0.0.1 : Reserved for loopback

Testing Local TCP/IP Stack

Pinging the local host confirms that TCP/IP is installed and working on the local host.

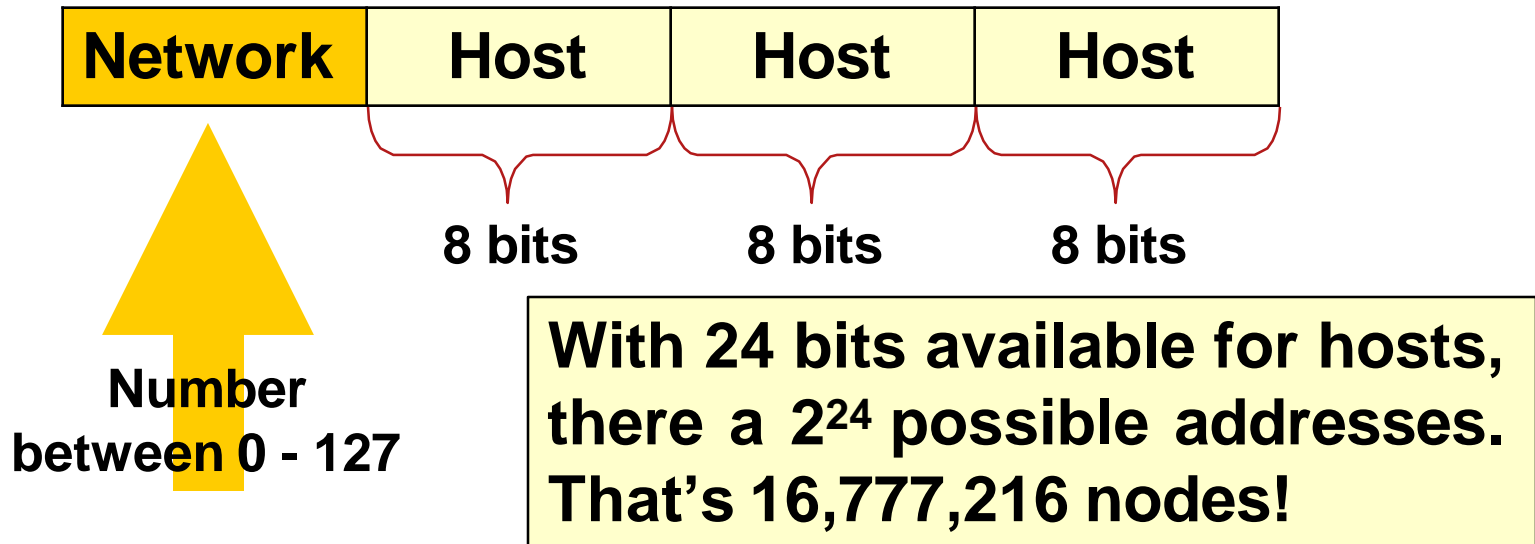

Pinging 127.0.0.1 causes a device to ping itself.

NIC's (Network Interface Cards)

Class A addresses

First octet is between 0 – 127, begins with 0

- No of network = $2^7 = 128$
 - There are 126 class A addresses.
 - 0 and 127 have special meaning and are not used.
- No of host = $2^{24} - 2 = 16,777,214$ host addresses, one for network address and one for broadcast address.
- Only large organizations such as the military, government agencies, universities, and large corporations have class A addresses.
- For example ISPs have 24.0.0.0 and 63.0.0.0

Default Mask: 255.255.0.0 (/16)

Class B addresses

First octet is between 128 – 191, begins with 10

**Number
between
128 - 191**

**With 16 bits available for hosts,
there a 2^{16} possible addresses.
That's 65,536 nodes!**

- No of network = 2^{14} = 16,384
- No of host = $2^{16} - 2$ = 65,534 host addresses, one for network address and one for broadcast address.
- Class B addresses are assigned to large organizations including corporations (such as Cisco, government agencies, and school districts).

Default Mask: 255.255.255.0 (/24)

Class C addresses

First octet is between 192 – 223, begins with 110

**Number
between
192 - 223**

8 bits

**With 8 bits available for hosts,
there a 2^8 possible addresses.
That's 256 nodes!**

- No of network = $2^{21} = 2,097,152$
- No of host = $2^8 - 2 = 254$ host addresses, one for network address and one for broadcast address.

IP Address Classes

Address Class	RANGE	Default Subnet Mask
A	1.0.0.0 to 126.255.255.255	255.0.0.0
B	128.0.0.0 to 191.255.255.255	255.255.0.0
C	192.0.0.0 to 223.255.255.255	255.255.255.0
D	224.0.0.0 to 239.255.255.255	Reserved for Multicasting
E	240.0.0.0 to 254.255.255.255	Experimental

Note: Class A addresses 127.0.0.0 to 127.255.255.255 cannot be used and is reserved for loopback testing.

IP address types

- **IP address could be one of three categories**
 - ✓ Network address
 - ✓ Host address
 - ✓ Broadcast address

Network / Broadcast Addresses

- Network address :

the first IP address in it which all host part bits = 0

- Broadcast address:

the last IP address in the network which all host part bits = 1

no.of host bits

- other addresses are host addresses = $2^{\text{no.of host bits}} - 2$

-Here are some examples:

<u>Class</u>	<u>Network Address</u>	<u>Broadcast Address</u>
A	12.0.0.0	12.255.255.255
B	172.16.0.0	172.16.255.255
C	192.168.1.0	192.168.1.255

Are You the Host or the Network?

- Network address: This is the designation used in routing to send packets to a remote network—for example, 10.0.0.0, 172.16.0.0, and 192.168.10.0.
- Broadcast address: The address used by applications and hosts to send information to all nodes on a network is called the broadcast address.
- Each Network is assigned a network address & every device or interface (such as a router port) on the network is assigned a host address
- A host address cannot be designated by all zeros or all ones.
- These are special addresses that are reserved for special purposes

Types of Addresses

Network Addresses have all 0's in the host portion.
